Carbon Capture Multidisciplinary Simulation Center

Creator: PHILIP SMITH

Affiliation: University of Utah

Funder: United States Department of Energy (DOE)

Template: Department of Energy (DOE): Generic

Grant number: DE-NA0002375

Project abstract:
The Carbon Capture Multidisciplinary Simulation Center (CCMSC) was established to demonstrate positive societal impact of extreme computing by deployment of low-cost, low-carbon energy solution for power generation. The overall strategy includes collaboration with our industrial partner, General Electric Power, with an interdisciplinary focus on development of high-performance computing technology. Three teams contribute to the overarching predictive science: the computer science team, the physics team and the validation/UQ team.

Data sharing and preservation

Data Sharing and Preservation
Two types of data are generated, shared and preserved as part of this research program: 1) simulation data, and 2) experimental data.

1) Simulation Data: The primary data artifacts of the research will be implementations of new algorithms and methodologies in software. The Uintah repository and the Arches Solid Fuel Combustion Application will house that software and will be released as open-source code with basic documentation. This open-source software repository is hosted by the Scientific Computing and Imaging Institute (SCI) at the University of Utah.

2) Experimental Data: All experimental and analytical data from this project, whether captured or generated by the center or by project collaborators, will be submitted to the Department of Energy Energy Data Exchange (EDX) for sharing and preservation. Data will become available to the public once all research results are published and/or any center intellectual property produced under this research project is protected sufficiently. Results will also be published in standard peer-reviewed journals to ensure the widest possible dissemination of our results.

Data used in publications

Data Used in Publications
Secondary data artifacts will pertain to the digital research data needed to validate published research findings: the input files, input data, and metadata (e.g., number of processors, threads, etc.) used to generate any published data; instructions or scripts that enable others to reproduce simulations; instructions or scripts required for data analysis; and, data analysis results used to produce tables, plots, and charts in publications. These secondary data will be submitted as an appendix to every journal article submitted. The hope is that journals will find ways to share these data with the published articles. However, the center will maintain a web-based library of all journal articles and will preserve and share these appendices.

Data management resources

Data Management Resources
The timeline for preserving and sharing data will be no less than three years after the research results are published. The resources for curating these data as described in this DMP are available within the Center at the University of Utah, at the DOE (EDX), and presumably at the organizations owning the scientific journals.

Confidentiality, security and rights

Confidentiality, Security and Rights
The UofU has agreed to release intellectual property rights on this project. All research software will be distributed as open-source.
This project will make use of computational resources from DOE at the University of Utah (UofU).
and at the DOE Lawrence Livermore National Laboratory (LLNL). In compliance with federal, state, and local statues and regulations, UoU and LLNL have established standards and policies regarding the transmittal, storage, and destruction of data to protect confidentiality, personal privacy, Personally Identifiable Information, U.S. national interests, proprietary interests, and intellectual property rights. All participants in this program will conduct all work in accordance to these standards. In some cases some proprietary analysis software may be used. In these instances, raw data will not be supplied, but the available summary data tables will supply a sufficient representation of the data to allow validation of the results.

The UoU storage resources are managed by the Center for High Performance Computing (CHPC). The housing, electrical power, and manpower associated with this support is contributed by the University. It includes maintenance of the hardware, automatic backup, redundant and off-site backup storage, security with user authentication, user access and user removal.
