Plan Overview

A Data Management Plan created using DMPTool

Title: IMPACT OF SUSTAINABLE INTENSIFICATION OF BEEF PRODUCTION IN TROPICAL AREAS ON CLIMATE CHANGE MITIGATION

Creator: Marcia Fernandes - ORCID: 0000-0001-8787-9668

Funder: São Paulo Research Foundation (fapesp.br)

Funding opportunity number: 2017/18750-7

Template: Digital Curation Centre

Project abstract:
Focused on the awareness of climate change, food shortage risks and the concept of sustainable intensification, the main purpose of this project is to measure the environmental and productive impact of process of cattle ranching intensification and to develop a comprehensive set of indicators for ecologically sustainable intensification of beef cattle. We also aimed to measure emissions factors (EFs) for methane (CH4), nitrous oxide (N2O) and ammonia (NH3) to improve greenhouse gases (GHG) inventories e balance. There are two EFs for N2O, one for fertilizer (EF1) and other for animal excreta (EF3PRP) that are used to being quantified separately. However, in the pastoral system, fertilizer is applied on the excreta therefore; we will measure for the first time these two EFs simultaneously in tropical conditions. The experimental area will consist of 24 ha of Brachiaria brizantha Hochst ex A. Rich Stapf cv. Marandu pasture divided into 12 paddocks of approximately 2 ha each. The Marandu grass pasture was implemented in 2005/2006, with no interference (fertilizations) for at least five years. The experiment will be repeated for two consecutive years. Within each year, the experiment will be divided in two stages: rearing phase (rainy season, from November to March; rainy-dry transition, from April to June), and finishing phase on pasture or in feedlot (dry season, from July to September). The treatments will consist of three cattle ranching intensification (low, intermediate and high) in a completely randomized design with four replicates (paddocks), characterized by stocking rates of approximately 1.5, 3.5 and 5.5 animal unit (AU)/ha; respectively. Pasture evaluation will include herbage mass and forage quality determination. Animal response variables include intake and nutrient digestibility, enteric CH4, N balance, performance, carcass yield, and protein and energy deposition. Environmental impacts to be assessed include N loss through volatilization of NH3 and N2O; CO2 and CH4 from excreta and N fertilization; and CH4 enteric. Finally, GHG balance and carbon footprint will be estimated through the calculation of the emissions of GHG from animals and fertilizer and the emission of fossil CO2 by other activities.

Start date: 09-01-2018

End date: 03-30-2021

IMPACT OF SUSTAINABLE INTENSIFICATION OF BEEF PRODUCTION IN TROPICAL AREAS ON CLIMATE CHANGE MITIGATION

Data Collection

What data will you collect or create?
The experimental data will be collected from field measurements and laboratory analysis. Field measurements will gather data from animal, pasture, soil and static chambers, whose type will be as follow:
- Data from animal: weight, enteric methane emission, intake of feed, feces, urine, in vivo ultrasound images in the 12-13th ribs, carcass weight.
- Data from pasture: stocking, sward height, herbage mass, morphological composition (leaf, stem and dead material proportion).
- Data from soil: Soil density, nitrate, nitrite, gravimetric water content, percent water filled pore space, ammonium-N, organic matter, P, Ca, Mg, K, cation exchange capacity, pH, H+Al, base saturation.
- Data from static chambers: air samples to be analyzed for CH4, N2O and CO2 using gas chromatography. In addition, semi-open chamber will be used to collect data of NH3 volatilization.
- Laboratory analysis will generate data from chemical analysis of forage, diet ingredients, feces, urine and carcass.
- Daily maximum, mean, and minimum temperatures and daily rainfall precipitation will be obtained at a meteorological station located 1.5 km from the experimental site.

How will the data be collected or created?
Firstly, data will be collected in the field or laboratory in notebooks, and then, immediately, typed in excel spreadsheets and stored in cloud server (Google Drive).

Documentation and Metadata

What documentation and metadata will accompany the data?
A file or spreadsheet with methodological procedures (in field and laboratory), including definition of variables, units of measurement and assumptions, will accompany the data.

Ethics and Legal Compliance

How will you manage any ethical issues?
The animals involved in the experiment were cared for according to the rules of the São Paulo State University Animal Ethics and Use Committee. The committee reviewed and approved the experiment and all procedures conducted in the study (protocol approval number 7979/18).

How will you manage copyright and Intellectual Property Rights (IP/IPR) issues?
The data will be available in the Unesp open access repository, after publication of reports at events (congresses, symposia) and scientific journals. The metadata of the research will be public, however the data can only be shared and used by citing the authors.

Storage and Backup

How will the data be stored and backed up during the research?
The data will be stored at Google Drive cloud.

How will you manage access and security?
All members of the research group involved in this project will have access to the files as readers, but only the responsible researcher and coordinator will be able to edit them.

Selection and Preservation
Which data are of long-term value and should be retained, shared, and/or preserved?
All data will be considered as long-term data.

What is the long-term preservation plan for the dataset?
Data will be preserved and stored in the Google Drive cloud as further as possible, or at least for 10 years. Other data will be available in the institutional repository of Unesp, according to publisher’s policy. The data will be preserved according to the repository policy.

Data Sharing

How will you share the data?
The not-published data will be partially and/or fully disclosed in scientific events. The results will be prepared as original research articles for submission in periodicals in the area. Data will be available in the institutional repository of Unesp, according to publisher’s policy.

Are any restrictions on data sharing required?
Question not answered.

Responsibilities and Resources

Who will be responsible for data management?
The project coordinator will be responsible for data management.

What resources will you require to deliver your plan?
Question not answered.
