Plan Overview

A Data Management Plan created using DMPTool

Title: NSF-BSF: Coastal Ocean Processes of North-East Greenland

Creator: Andreas Muenchow - ORCID: 0000-0001-8360-5686

Affiliation: University of Delaware (udel.edu)

Funder: National Science Foundation (nsf.gov)

Funding opportunity number: PD 98-1610 - Physical Oceanography

Template: Arctic Data Center: NSF Polar Programs

Project abstract:
We propose to analyze a unique 2014-18 ocean data set to investigate dynamics at this scale with mooring, survey, satellite, and modeling data. We hypothesize that canyon dynamics control across-shelf property and energy flux by the interaction of rotation, topography, and friction at tidal to interannual time scales.

Start date: 06-30-2022

Last modified: 08-11-2021

The above plan creator(s) have agreed that others may use as much of the text of this plan as they would like in their own plans, and customize it as necessary. You do not need to credit the creator(s) as the source of the language used, but using any of the plan's text does not imply that the creator(s) endorse, or have any relationship to, your project or proposal.
The principal investigator Andreas Muenchow will be responsible for all data management of this project. He will train project personnel including the two graduate students, Sohyun Bae and Michael Copella in proper data handling and management skills. The NSF Arctic Data Center will provide data archival, preservation, access and metadata authoring services for the project.

Types of data produced

Ocean data used in this project has been collected between 2014 and 2018 as part of a large and international effort led by the Alfred Wegener Institute in Germany with support from the research icebreaker R/V Polarstern. All sensor data are archived in the public domain at https://www.pangaea.de/ where searches for PS85, PS100, PS109, and PS114 will provide direct access to both survey and mooring data from 2014, 2016, 2017, and 2018. Nevertheless, these data are lightly processed “raw” data that will benefit from additional processing and calibration as done by the Principal Investigator Andreas Muenchow in Muenchow et al. (2020) for a small subset of ADCP mooring data.

Atmospheric and wind data originate from two sources. First, these are standard stations maintained by the Danish Meteorological Institute that are also distributed by the U.S. National Center for Environmental Information. Second, wind data of the European Centre for Medium-Range Weather Forecasting produce ERA-5 will be used. Remotely sensed optical (LandSat, MODIS), microwave (SSM/I), and synthetic aperture radar (Sentinel-A and Sentinel-B) data from both US and European satellites will be used to describe sea ice distributions. All these data reside in public archives maintained by government organizations in the USA (NASA, USGS) and Europe (ESA, Copernicus).

What will be the approximate number and size of data files that will be produced during your project?
The “raw” data presently in public German data archives that this project will utilize approaches about 2 TB. We expect that the submission of processes, calibrated, and reduced data will be a factor 1000 smaller, about 2 GB. No high volume satellite or numerical modelling output data will be provided as these data streams are provided and maintained by NASA in the USA and ESA in Europe.

What type of metadata (information others might need to use your data) will be collected during your project?
All meta-data will be provided in plain text format. Furthermore, location (longitude, latitude, depth) and time strings (date, hour, minute) are always attached as columns in all ocean mooring and survey files.

Policies for access and sharing

How will data be accessed and shared during the course of the project?
For the duration of the project all project data not available in public archives will be shared online without restrictions on the server http://muenchow.cms.udel.edu that the principal investigator maintains for professional and public outreach purposes and http://muenchow.cms.udel.edu/ForSohyun/ perhaps serves as an example of internal yet open data sharing. Towards the end of the project the data on that server will transition with modifications to the Arctic Data Center.

Will any of the data and/or related materials produced need provisions for appropriate protection of privacy, confidentiality, security, intellectual property, or other rights or requirements? If so describe them and detail any requested exceptions from the archiving requirements set for Arctic Sciences research.
No protections are needed.

When is the approximate release date of the data products?
Note: Arctic Observing Network (AON) data must be deposited in a long-lived and publicly accessible archive within 6 months of collection, and Arctic Social Science Program (ASSP) research data must be deposited in a long-lived and publicly accessible archive within 5 years of the award date assuming no exceptions to the archiving requirements are requested.
Value-added, that is processed, calibrated, and condensed data will be submitted to the Arctic Data Center during the last 6 months of the project starting 2025.
Policies for re-use and re-distribution

How do you anticipate the data for this project will be used? Consider the following:

1. Which bodies/groups are likely to be interested in the data?
2. What and who are the intended or foreseeable uses/users of the data?

The data will be used by an international community of physical oceanographers, ocean engineers, and government scientist with research, monitoring, or commercial interests in north-east Greenland.

Will any permission restrictions need to be placed on the data? Consider the following:

1. Who will be allowed to use the data?
2. How will others be allowed to use the data?
3. Will others be allowed to disseminate the data.

Note: If you are planning on restricting access, use, or dissemination of the data, you must explain in this section how you will codify and communicate these restrictions.

The raw data already reside in the public domain and all data products generated by this project will also reside in the public domain after completion of the effort in June of 2025. No restrictions will placed on any data that can be disseminated freely by anyone for any purpose.

Plans for archiving and preservation

What is the long-term strategy for maintaining, curating, and archiving the data?

Note: The Office of Polar Programs policy requires that metadata files, full data sets, and derived data products be deposited in a long-lived and publicly accessible archive.

The data manager will follow the NSF Arctic Data Center guidelines to provide accurate and complete documentation for data preservation. The NSF Arctic Data Center will ensure that the data are curated in a relevant long-term archive and ensure data will be available after project funding has ended.
