Plan Overview

*A Data Management Plan created using DMPTool*

DMP ID: https://doi.org/10.48321/D1T34Z

**Title:** Spreading depolarizations initiated by hypoxic-ischemic injury signal risk for brain death

**Creator:** Jesse Skoch - **ORCID:** 0000-0001-8869-6804

**Affiliation:** Cincinnati Children's Hospital Medical Center (cincinnatichildrens.org)

**Principal Investigator:** Jesse Skoch M.D., Candi LaSarge PhD, Jed Hartings PhD

**Data Manager:** Jesse Skoch M.D., Candi LaSarge PhD, Jed Hartings PhD, Carlie McCoy

**Funder:** National Institutes of Health (nih.gov)

**Template:** NIH-Default DMSP

**Project abstract:**

Decreases in brain oxygenation and blood flow during cardiac arrest or stroke cause a hypoxic-ischemic injury to the brain, which initiates a wave of self-propagating neural activation called a terminal spreading depolarization. These terminal spreading depolarizations are thought to contribute to physical and electrochemical changes in the brain that result in brain death. Experiments in this proposal will investigate the role of using clinically translatable technology for early detection of terminal spreading depolarizations in ischemic brain injury, and test the ability of ketamine to prevent hypoxic-ischemic induced terminal spreading depolarizations.

The above plan creator(s) have agreed that others may use as much of the text of this plan as they
would like in their own plans, and customize it as necessary. You do not need to credit the creator(s) as the source of the language used, but using any of the plan's text does not imply that the creator(s) endorse, or have any relationship to, your project or proposal.
Spreading depolarizations initiated by hypoxic-ischemic injury signal risk for brain death

Data Type

Types and amount of scientific data expected to be generated in the project: Summarize the types and estimated amount of scientific data expected to be generated in the project.

Describe data in general terms that address the type and amount/size of scientific data expected to be collected and used in the project (e.g., 256-channel EEG data and fMRI images from ~50 research participants). Descriptions may indicate the data modality (e.g., imaging, genomic, mobile, survey), level of aggregation (e.g., individual, aggregated, summarized), and/or the degree of data processing that has occurred (i.e., how raw or processed the data will be)

In this proposed project, data will be generated via the following methods: Fluorescence and reflected light microscopy, Immunohistochemistry. This data will be collected from a minimum of 10 independent experiments, with each independent experiment consisting of 6 groups. The total size of the data collected is projected to be 3 TB.

We expect to generate the following data file types and formats during this project: Nikon elements image files (.ND2), Immunohistochemistry photographs (.TIFF), and tabular data (.xlsx).

Raw data files will be analyzed to generate tabular data files containing density of immunohistochemical markers, brain regions where markers are localized, and microscope intensity data at 3 different wavelengths over time for statistical analysis.

Scientific data that will be preserved and shared, and the rationale for doing so: Describe which scientific data from the project will be preserved and shared and provide the rationale for this decision.

All data produced in the course of the project will be preserved and shared.

Metadata, other relevant data, and associated documentation: Briefly list the metadata, other relevant data, and any associated documentation (e.g., study protocols and data collection instruments) that will be made accessible to facilitate interpretation of the scientific data.

To facilitate the interpretation of the data, metadata, protocols, and data collection instruments will be shared and associated with the relevant datasets. The protocol, data dictionary, and codebook will
be accessible in data repositories where data are shared

An additional file, including software programs, will be provided alongside the raw datasets being shared. Any non-standard abbreviations or indicators will be clearly defined in a data dictionary as needed and provided with the datasets being shared.

Data on all study animals (DOB, pedigree, genotype, sex and vivarium housing conditions) is stored using mLIMS Transgenic Mouse Colony Management software. All animals receive a unique identifier code which is carried through to lab notebooks and computer databases (Excel, Sigma Plot, Graphpad Prism) to track all experimental procedures and data.

**Related Tools, Software and/or Code**

State whether specialized tools, software, and/or code are needed to access or manipulate shared scientific data, and if so, provide the name(s) of the needed tool(s) and software and specify how they can be accessed.

Confocal image data is captured using Nikon software and is stored as .ND2 files. Raw data will be arranged into Microsoft Excel, Sigma Plot, and Graphpad Prism for data collection, statistical analyses and graphing. These tools are fee-based, proprietary software.

**Standards**

State what common data standards will be applied to the scientific data and associated metadata to enable interoperability of datasets and resources, and provide the name(s) of the data standards that will be applied and describe how these data standards will be applied to the scientific data generated by the research proposed in this project. If applicable, indicate that no consensus standards exist.

No consensus data standards exist for the scientific data and metadata to be generated, preserved, and shared.

**Data Preservation, Access, and Associated Timelines**

Repository where scientific data and metadata will be archived: Provide the name of the repository(ies) where scientific data and metadata arising from the project will be
archived; see [Selecting a Data Repository](#)

All datasets that can be shared will be deposited in the Mendeley Data Repository. Data will be shared upon publication.

**How scientific data will be findable and identifiable:** Describe how the scientific data will be findable and identifiable, i.e., via a persistent unique identifier or other standard indexing tools.

The Mendeley Data Repository provides searchable study-level metadata for dataset discovery. Mendeley assigns DOIs as persistent identifiers, and has a robust preservation plan to ensure long-term access. Data will be discoverable online through standard web search of the study-level metadata as well as the persistent pointer from the DOI to the dataset. Upon publication, data will be made available, unless specific data is recognized as proprietary and requires a data sharing agreement.

**When and how long the scientific data will be made available:** Describe when the scientific data will be made available to other users (i.e., no later than time of an associated publication or end of the performance period, whichever comes first) and for how long data will be available.

Data will be made available within 24 months of the initial award for available data or at the time of associated publication, whichever comes first. The final data will be made available no later than a year after the end of the grant award.

**Access, Distribution, or Reuse Considerations**

Factors affecting subsequent access, distribution, or reuse of scientific data: NIH expects that in drafting Plans, researchers maximize the appropriate sharing of scientific data. Describe and justify any applicable factors or data use limitations affecting subsequent access, distribution, or reuse of scientific data related to informed consent, privacy and confidentiality protections, and any other considerations that may limit the extent of data sharing. See [Frequently Asked Questions](#) for examples of justifiable reasons for limiting sharing of data.

All data will be retained indefinitely to maintain access for any future use by internal or external parties. Data will be uploaded to the Mendeley Data Repository prior to or at the time of submission for publication. Only in the instances in which data is determined to be proprietary will a data-sharing agreement be required. We will follow NIH guidelines on data sharing in conjunction with
our institutional guidelines.

**Whether access to scientific data will be controlled:** State whether access to the scientific data will be controlled (i.e., made available by a data repository only after approval).

Controlled access will not be used. The data that is shared will be shared by unrestricted download.

**Protections for privacy, rights, and confidentiality of human research participants:**
If generating scientific data derived from humans, describe how the privacy, rights, and confidentiality of human research participants will be protected (e.g., through de-identification, Certificates of Confidentiality, and other protective measures).

No scientific data derived from humans will be produced from this study.

**Oversight of Data Management and Sharing**

Describe how compliance with this Plan will be monitored and managed, frequency of oversight, and by whom at your institution (e.g., titles, roles).

Data will be owned by CCHMC and adhere to any copyright or IP rights designated by our institution. Data sharing will comply with standards set forth by the NIH and will be made available upon publication at a designated repository.

Data is stored on a secure server in at least two separate locations to ensure data can be recovered in the event of an incident. Data stored on the secured servers prior to publication are password protected and will be managed by the information services division at CCHMC in addition to the laboratory. Collaborators are all in-house and will not require additional access outside our standard procedures at CCHMC.

The PIs of the study will be responsible for implementing the DMP and ensuring it is reviewed and revised as needed. Mendeley Data Repository is a free site for managing and sharing data. We will use this alongside support from our IS division, which has expertise in DMPs.
