

Plan Overview

A Data Management Plan created using DMPTool

Title: Effect of vegetation height, percent green growth, and fuel load on fire temperatures of prescribed rangeland burns

Creator: Milan Piva

Affiliation: Non Partner Institution

Principal Investigator: Milan Piva

Data Manager: Milan Piva

Funder: Joint Fire Science Program (JFSP)

Funding opportunity number: 12652

Template: Joint Fire Science Program

Effect of vegetation height, percent green growth, and fuel load on fire temperatures of prescribed rangeland burns

Field sample collections of vegetation height and percent coverage. Fuel load biomass clippings. Running a multiple linear regression to evaluate if there is a relationship between my independent variables of vegetation height, percent coverage of green vegetation, and fuel load.

All measurements will be recorded using paper and pen then transferred to an electronic format on Excel. Data points will be proof read after transcription to ensure no errors were made by both the transcriber and a peer. Hard copies of the data, both the original and Excel copies will be made and stored in principal investigators office.

Data will be publicly available, but the editing rights will be granted only to the PI

The data will be physically stored in the office of the PI. Electronic copies will be saved on a University computer with back up copies stored in two separate folders. The data will also be stored on a portable flash drive and an online storage bank only accessible by the PI. Backups will be made each time an edit has been made to the data. The PI is responsible for the storage and backup of the project data.

I will use the FGDC 2.0 and Biological Data Profile standards. Metadata will be created using Metavist and be saved as an XML document.

Forest Service Research Data Archive

Data will become available to the public upon completion of the Joint Fire Science Program requirements.
