The other diplomats: Exploring the role and practices of non-member state diplomacy at the EU

Data Types, Formats, Standards and Capture Methods

This article explores one particular arena for external influence which has been left virtually untouched by EU studies, namely that of the non-member state's diplomatic missions to the EU. First, the article identifies the diplomats' own raison d'être, maps the policy priorities of each mission, and investigates the practices employed for maneuvering through EU system in effectuating these policy priorities. Secondly, based on the diplomats' own account, the article evaluates the level of influence that the diplomats have had, and potentially can have, on facilitating, shaping and changing three key aspects of the EU's foreign policy portfolio: EU integration, trade and development, as well as security and defense.

I will primarily be collecting data from interviews with diplomats stationed in Brussels, accredited to the EU. The Union hosts about 125 diplomatic missions outside its member states. I am to get an interview with approximately all the heads of delegation and some follow up interviews.

Ethics and Intellectual Property

There are no copyrights issues that I can see related to this project. Key for information gathering of this kind is confidentiality. This means under any circumstances I will be able to share my interview transcripts whether full or in part. I will anonymize the research subjects throughout the research process. While the email will necessarily identify the subjects by name, any references to the subjects in transcripts etc will be made by pseudonyms in which the key will be analogly kept in a place only I have access to.

Access, Data Sharing and Reuse

It is impossible for me to share the interview transcripts with any other researchers. This would violate the trust between me and the interviewee. However, the statistics The survey I gather data about, mapping the various tasks and methods of the diplomats in EU could potentially be made public. I will then of course do so in line with my University's guidelines on data sharing and the publication journal I will submit to.

Short-Term Storage and Data Management

As far as data handling, storage and security and personal information goes, I am aiming to protect my sources. A preliminary solution would be to me being the only person with access to the interview and the transcribed version of the interview. The audio file of recorded interviews will be stored on an external hard drive which will not be moved until all the data is deleted. Here, the transcribed version of the interview should not under any circumstances identify persons or locations that might reveal the interviewee's identity. In the transcribed version I am thinking about using pseudonyms. The list of names and the keys for these pseudonyms will be kept on a physical note in a place only known by me.
Deposit and Long-Term Preservation

I will keep the data available for 5 years after the last article is published, given any inquiries that might arise after the research process has been completed. I will store this data again on an external hard drive. This hard drive also functions as a server, in that it has a backup hard drive which is constantly backing up the material on hard drive number 1.

Resourcing

I will require some basic hardware such as a microphone to record the interviews, a computer to transcribe the interviews along with some basic statistics software to create descriptive tables generated from the interviews. All these resources are or will be made available to me by the University.
