

## Plan Overview

---

*A Data Management Plan created using DMPTool*

**Title:** NSF-BSF: Coastal Ocean Processes of North-East Greenland

**Creator:** Andreas Muenchow - **ORCID:** [0000-0001-8360-5686](https://orcid.org/0000-0001-8360-5686)

**Affiliation:** University of Delaware (udel.edu)

**Funder:** National Science Foundation (nsf.gov)

**Funding opportunity number:** PD 98-1610 - Physical Oceanography

**Template:** Arctic Data Center: NSF Polar Programs

**Project abstract:**

We propose to analyze a unique 2014-18 ocean data set to investigate dynamics at this scale with mooring, survey, satellite, and modeling data. We hypothesize that canyon dynamics control across-shelf property and energy flux by the interaction of rotation, topography, and friction at tidal to interannual time scales.

**Start date:** 07-01-2022

**Last modified:** 08-11-2021

## NSF-BSF: Coastal Ocean Processes of North-East Greenland

The principal investigator Andreas Muenchow will be responsible for all data management of this project. He will train project personnel including the two graduate students, Sohyun Bae and Michael Copella in proper data handling and management skills. The NSF Arctic Data Center will provide data archival, preservation, access and metadata authoring services for the project.

Ocean data used in this project has been collected between 2014 and 2018 as part of a large and international effort led by the Alfred Wegener Institute in Germany with support from the research icebreaker R/V Polarstern. All sensor data are archived in the public domain at <https://www.pangaea.de/> where searches for PS85, PS100, PS109, and PS114 will provide direct access to both survey and mooring data from 2014, 2016, 2017, and 2018. Nevertheless, these data are lightly processed "raw" data that will benefit from additional processing and calibration as done by the Principal Investigator Andreas Muenchow in Muenchow et al. (2020) for a small subset of ADCP mooring data.

Atmospheric and wind data originate from two sources. First, these are standard stations maintained by the Danish Meteorological Institute that are also distributed by the U.S. National Center for Environmental Information. Second, wind data of the European Centre for Medium-Range Weather Forecasting produce ERA-5 will be used.

Remotely sensed optical (LandSat, MODIS), microwave (SSM/I), and synthetic aperture radar (Sentinel-A and Sentinel-B) data from both US and European satellites will be used to describe sea ice distributions. All these data reside in public archives maintained by government organizations in the USA (NASA, USGS) and Europe (ESA, Copernicus).

The "raw" data presently in public German data archives that this project will utilize approaches about 2 TB. We expect that the submission of processes, calibrated, and reduced data will be a factor 1000 smaller, about 2 GB. No high volume satellite or numerical modelling output data will be provided as these data streams are provided and maintained by NASA in the USA and ESA in Europe.

All meta-data will be provided in plain text format. Furthermore, location (longitude, latitude, depth) and time strings (date, hour, minute) are always attached as columns in all ocean mooring and survey files.

All processed and calibrated data will be provided to the Arctic Data Center as Comma or Space Separated Values.

For the duration of the project all project data not available in public archives will be shared online without restrictions on the server <http://muenchow.cms.udel.edu> that the principal investigator maintains for professional and public outreach purposes and <http://muenchow.cms.udel.edu/ForSohyun/> perhaps serves as an example of internal yet open data sharing. Towards the end of the project the data on that server will transition with modifications to the Arctic Data Center.

No protections are needed.

Value-added, that is processed, calibrated, and condensed data will be submitted to the Arctic Data Center during the last 6 months of the project starting 2025.

The data will be used by an international community of physical oceanographers, ocean engineers, and government scientist with research, monitoring, or commercial interests in north-east Greenland.

The raw data already reside in the public domain and all data products generated by this project will also reside in the public domain after completion of the effort in June of 2025. No restrictions will be placed on any data that can be disseminated freely by anyone for any purpose.

The data manager will follow the NSF Arctic Data Center guidelines to provide accurate and complete documentation for data preservation. The NSF Arctic Data Center will ensure that the data are curated in a relevant long-term archive and ensure data will be available after project funding has ended.
